Introducing: Hackear Facebook sin encuestas This article is about how to hack facebook without using surveys. It covers the basic idea of what is a phishing attack, how it works and why your account is without consequences, with many interesting facts and warning signs that can help you keep your account secure and malware-free!

I hope you find this article helpful and do not forget to follow the recommended tips in order to avoid falling into a phishing trap! :)

There's nothing quite like spending time on Facebook - we share pictures of our kids, stories about our day, music videos... It's a great social network, full of interesting people and places to visit, all within a few taps on your mobile phone. That being said, Facebook is also a business too. Many companies use it as a way to reach out to potential customers and gain their loyalty or just for Likes for the sake of likes. And if they use that opportunity to gain access into your account... wait... what? :O In this article I will explain how phishing could happen, how you can avoid those kinds of attacks from happening to you and I will show you some basic security tips as well as the easiest ways how phishing pages look like. You may feel skeptical, but I think it's important to be aware of scenarios like these. Because not everyone is aware how phishing works and even less people know the simplest ways how it can be avoided, so there's a high potential that someone could get into your account and you don't even realize it yet. While many people think that you need to be super cautious when accessing your facebook account or when ordering something online because you really don't know who is behind the screen asking for your personal information - in reality, that's not always true. There are many ways of hacking into people's accounts without their knowledge. And the most common way of doing this is through a malware attack. A malware attack is a virus that can not only infect your computer but also your smartphone and other devices you use to access Facebook. What makes the infection so hard to notice is its sneaky way of transmitting itself - through hacking, guessing passwords, installing it on your device, hacking into other devices you own or even making you install it yourself! You may feel skeptical now, but many people agree that phishing attacks are becoming more and more popular nowadays because not everyone knows how they work. Which means there's a high possibility that could happen to you one day. But to help you better understand it and to prevent any possible phishing attacks from happening to you, I will show you in this article how a phishing attack could happen and the things you can do in order to prevent them. Here we go!

Now, imagine if your favorite app were redirected to a website that looked like Facebook, but in fact was a different website entirely. It would be quite tricky to figure out that this was not the real Facebook. This is all thanks to what is known as a phishing attack.
